**DESCRIPTION**

The **HCC4066B** (extended temperature range) and **HCF4066B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package and plastic micropackage. The **HCC/HCF4066B** is a quad bilateral switch intended for the transmission or multiplexing of analog or digital signals. It is pin-for-

## HCC/HCF4066B

pin compatible with **HCC/HCF4016B**, but exhibits a much lower ON resistance. In addition, the ON resistance is relatively constant over the full input-signal range. The **HCC/HCF4066B** consists of four independent bilateral switches. A single control signal is required per switch. Both the p and the n device in a given switch are biased ON or OFF simultaneously by the control signal. As shown in schematic diagram, the well of the n-channel device on each switch is either tied to the input when the switch is ON or to  $V_{SS}$  when the switch is OFF. This

configuration eliminates the variation of the switch-transistor threshold voltage with input signal, and thus keeps the ON resistance low over the full operating-signal range. The advantages over single-channel switches include peak input signal voltage swings equal to the full supply voltage, and more constant ON impedance over the input-signal range. For sample-and-hold applications, however, the **HCC/HCF4016B** is recommended.
